

Alexander Doria aed2395  
Paul Cozzi pac2472  
Fall 2016

Alexander worked on BFS initially but worked with Paul throughout most of the process bouncing ideas around to find a solution.

Paul worked on DFS initially but worked in the same room during most of the process so both would give feed back on various ideas about the algorithm.

The WordNode class and the makeWordLadder method were worked on by Alexander, while Paul worked on initialize, parse, and a DFS helper function.

3 test cases were written by Alexander and 6 test cases were written by Paul.

We spent approximately 9 hours together in the same room. We would constantly be sharing our screens to help bounce ideas off each other which caused a lot of discussion.

Final testing was done together in the same room.
